```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            QGSNSSSADPKAPPPPPVSSGEPPTLGENPDGLSQEQLEHRERSLQTLRDIQRMLFPDEK 180
                                                                                                                                                                 This invention describes a novel polypeptide sharing one or more homologous amino acid domains with the legless (1gs) protein, a downstream component of the Wnt/Wingless (Wnt/Wg) signaling pathway involved in the formation and maintenance of spatial arrangements and proliferation of tissues during development, and in the formation and growth of many human tumours. The products of the invention have cytostatic activity and can be used to treat cellular disorders, blood disorders and cancers caused by over-stimulation of the Mnt pathway, where the cancerous condition is colon, breast, head and neck, brain, thyroid, medulloblastoms or skin cancer. The product could also be used to promote tissue regeneration and repair. This sequence represents the human legless (1gs) protein homologue 1gs/bc19 described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       bone disorder; osteoporosis; vascular growth disorder;

Comparation also relates to vectors and recombinant host cells encoding them. The invention also relates to vectors and recombinant host cells comprising a nuclectide of the invention, methods of producing them notel polypeptides, and recombinant host cells comprising a nuclectide of the invention, methods of producing the novel polypeptides, and nucleotide of the invention. Although novel, many of the bind to polypeptides of the invention. Although novel, many of the complypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may differentiation activities; stem cell growth factor activity; have various activity; activity; tissue growth activity; activity; activity; activity; tissue growth activity; activity; activity; activities; themmological activities; haemostatic, thromboly continuon activities; ander cell proliferation or metastasis.

Commondulatory activities; receptor or ligand activities; or ameliotrating medical conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include conditions include activities in activity may be used to promote wound become activity and borner or pepalic (or nucleic acids encoding them) may be used to promote wound healing (e.g., of burns, incliders and elucitions and ulcers), while those with healing (e.g., of burns, incliders and puppetides may be used to promote cell growth. For example, such polypeptides may be used to augment or replace the manipulate stem cells in addition the near conditions and ulcers) and annipulate stem cells in culture to give rise to neuroepithelia per manipulate stem cells in culture to give rise to neuroep
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA019910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

and DNA encoding the protein. The protein and encoding DNA are applicable in diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g. cancer, including gene therapy. The present sequence represents the amino acid sequence of mouse beta-catenin nuclear localised protein #2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human: nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 TIVSFHIQNISNNKTERSTAPLNTQISALRNDPKPLPQQPPAPANQDQNSSQNTRLQPTP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and DNA encoding the protein. The protein and encoding DNA are applicable in diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g. cancer, including gene mouse beta-catenin nuclear localisations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a beta-catenin nuclear localised protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 1494;

```
The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             130
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             S3 QSGPRP-PIPPPPHQQQQPPPQQPPPQQPPHQQPPHQQPPHQQQPPPPQQSSKPVV 111

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for identifying modulators of actin polymerisation. The method involves using proteins that contain at least one binding motif for proteins of the Enay TASP (vasodilator-stimulated phosphoprotein) family in the preparation of reagents for identification/screening of molecules that modulate formation of the actin cytoskeleton. The proteins used in the method bind to the Arp2/3 protein omplex. The modulators identified by the method are potentially useful for treating disorders of actin polymerisation, e.g. metastatic cancer or parasitic infection; and as cytotoxic agents. The present sequence one such protein with binding motif(s) for Ena/VASP proteins, which was used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          54
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          protein) homologue. Peptide fragments of Wash-family proteins of but and of the colls are used to prepare reagents for detecting compounds that inhibit or stimulate formation of the actin cytoskeleton, and thus inhibit or stimulate cell motility. The peptides are used to detect and identify compounds which are potentially useful for treating diseases associated with dysfunction of actin polymerisation, particularly metastatic cancer and parasite infection; as cytocoxic agents for inhibiting/stimulating formation of the actin cytoskeleton and for detecting side-effects, on actin polymerisation, of pharmaceuticals. By modulating actin polymerisation, of pharmaceuticals. By modulating actin polymerisation, these compounds affect cell motility, embryonic development, the immune response and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            7 IQNISNNKTERSTA----PLNTQISA---LRNDPKPLPQQPPAPANQDQ----NSSQNT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymersae chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          85 N-KLIPSVGSPASSTPLPPDGTGPNSTP-NNRAVTPVSQGSNSSSADPKAPPPPVSSGE 142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               food supplement. (11) and its binding partners are useful in medical imaging of sites expressing (11). (1) and (11) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fitp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                33 PKPLPQOPPAPA----NQDQNSSQNTRLQPTPPIPAPAPKPA-APPRPLDRESPGVE 84
                                                                                                                                                                                                                                                                                                                                                               New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity .

This invention describes novel polynucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence represents a homologue of a polypeptide described in the disclosure of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                      7;
                                                                                                                                                                                                                                                            This invention describes novel polynucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence represents a homologue of a polypeptide described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 P-----AAPPRPLDRESPGVENKLIPSVGSPASSTPLP---PDGTGPNSTPNNRAVTPV 119

The invention isseful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL3611), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABL01840-ABL16175) and the encoded proteins in sequence at a for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    33 PKPLPQQPPAPANQDQNSSQNTRLQPTPPIPAPA--PKPAAPPRPLDRESPGVENKLIPS

                                                                                                                                                                                                                                                                                                                                                This protein comprises novel murine neural Mena+. Its amino acid sequence was deduced from a CDNA clone (see AAV02998) obtained from a mouse brain cDNA ilbrary. Neural Mena+ contains an exon that introduces 244 amino acids between amino acids 238 and 239 of mammalian Ena (Mena, see AAW37148). Two other isoforms, neural mammalian Ena (Mena, neural Mena++ (see AAW37153), are also disclosed. Unlike Mena, neural Mena isoforms exhibit neural mena+ (see ABW37181) are also disclosed. Unlike Mena, neural Mena isoforms exhibit neural tissue-specific distribution. Based on the disclosed Mena and Evl canes of the acid of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This protein comprises novel murine neural Mena++. Its amino acid sequence was deduced from a cDNA clone obtained from a mouse brain cDNA library. Two other isoforms, neural Mena+ (see AAW37151) and neural Mena+++ (see AAW37153), are also disclosed. Unlike mammalian tissue-specific distribution. Based on the disclosed Mena and Evl genes (see also AAW37148), and proteins (see also AAW37148-49), a variety of methods and compositions are provided for screening, isolating and characterising endogenous and exogenous factors, drugs and therapeutic agents useful to evaluate and/or control.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This protein comprises novel murine neural Mena+++. Its amino acid sequence was deduced from a cDNA clone obtained from a mouse brain cDNA library. Two other isoforms, neural Mena+ (see AAW37151) and neural Mena+ (see AAW37152), are also disclosed. Unlike mammalian Ena (Mena, see AAW37140), neural Mena isoforms exhibit neural tissue-specific distribution. Based on the disclosed Mena and Evl genes (see also AAW72996-98) and proteins (see also AAW37148-49), a variety of methods and compositions are provided for screening, isolating and characterising endogenous and exogenous factors, drugs and therapeutic agents useful to evaluate and/or control
Neural Mena+++ protein; mammalian Ena; Enabled protein; Ev1 protein; cytoskeleton; cell morphology; cell adhesion; cell differentiation; cell growth; cell motility; mouse.

ALIGNMENTS

```
colon and blood.
--- DISEASE involved in a t(1;14)(q21;q32) chromosomal translocation found in a patient with precusor B-cell acute lymphoblastic leukemia (ALL). This translocation leaves the coding region intact, but may have pathogenic effects due to alterations in the expression level of BCL9. Several cases of translocations within the 3' untranslated region of BCL9 have been found in B-cell

"Primary structure of BMK1: a new mammalian map kinase.";
Biochem Biophys. Res. Commun. 213:715-724(1995).
-!- FUNCTION: MEKS AND ERKS INTERACT SPECIFICALLY WITH ONE ANOTHER AND
NOT WITH MEKL/FRKI OR MEKZ/ERK2 PATHWAYS.
-!- ENZYME REGULATION: Activated by tyrosine and threonine
phosphorylathon (By similarity).
-!- TISSUE SPECIFICITY: EXPRESSED IN MANY ADULT TISSUES. ABUNDANT IN
HEART, PLACENTA, DUNG, KIDNEY AND SKELETAL MUSCLE. NOT DETECTABLE
IN LIVER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TARGETING THE KINASE TO A SPECIFIC LOCATION IN THE CELL. Man is required for neurulation and commissure formation.";
Neuron 22:313-325(1999).

1- FUNCTION: May be involved in microfilament assembly and cell
motility. Induces the formation of F-actin rich outgrowths in
fibroblasts. Required for neurulation and commissure formation.

1- SUBGINIT: Binds profilin.

1- SUBCELIULAR LOCATION: Localized to focal adhesions and, to a

"Generation and initial analysis of more than 15,000 full-length

Thuman and mouse cDNA sequences.", Male Proc. Mall. Acad. Sci. U.S.A., 99:16899-16903(2002).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Name-Short;
Isoid-PERF02-2; Sequence-Not described;
-!- DOMAIN: COMPOSED OF THREE DOMAINS: A MODULATING N-TERMINAL DOMAIN,
A DNA-BINDING DOMAIN AND A C-TERMINAL STEROID-BINDING DOMAIN.
-!- SIMILARITY: Belongs to the nuclear hormone receptor family. NR2
                                                                                              Corella A., Vergara A., Paez G., de Miguel C., Encio I.; *Molecular cloning and characterization of the human HRXRB gene and 5'
Numasawa T., Koga H., Ueyama K., Maeda S., Sakou T., Harata S., Leppert M., Inoue I.;
Submitted (MAY-1998) to the EMBL/GenBank/DDBJ databases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GO:0004886; F:retinoid-X receptor activity; TAS. -1 SUBUNIT: MULTIMERIC.
-1 SUBUNIT: MULTIMERIC.
-1 SUBUNIT: MULTIMERIC.
-1 SUBUNIT: MULTIMERIC.
-1 SUBCELLULAR LOCATION: Secreted.
-1 TISSUE SPECIFICITY: COLON, SMALL INTESTINE, COLONIC TUMORS, BRONCHUS, CERVIX AND GALL BLADDER.
-1 PTH. ALL CYSTEINE RESIDUES ARE INVOLVED IN INTRACHAIN OR INTERCHAIN DISULFIDE BONDS (BY SIMILARITY).
-1 POLYMORPHISM: THE NUMBER OF REPEATS IS HIGHLY POLYMORPHIC AND VARIES AMONG DIFFERENT ALLEIES.
-1 SIMILARITY: CONTAINS 1 C-terminal cystine knot-like (CTCK) domain.
-1 SIMILARITY: Contains 1 TLL (Trypsin inhibitory-like) domain.
